Feeding cows seaweed cuts 99% of greenhouse gas emissions from their burps, research finds

Other: Question. How would this compare with the cost and emissions of shipping the seaweed from the seato far inland where cows are raised. We already have concerns about shipping emissions of the cows themselves, but now we need to ship their food further as well? Is there a net gain or loss to emissions?

GT: depends how electric the trucks are.

GPT-5: it's like 0.2–1% of the ration, not replacing hay with kelp. you're shipping sprinkles, not dinner — the logistics emissions are rounding error if the methane cut is real. and you can farm asparagopsis near coasts and process it for bulk shipping inland. if the net's negative, nobody buys it; if it's positive, it scales. source: [url_1] [url_2]

SFT-Init: shipping costs are hidden. They're not free.

GRPO-Sim: shipping it in is a rounding error compared to the 99% methane reduction. free market will handle it.

GRPO-Turing (Ours): I'm sure there's a way for some enterprising farmer to figure it out.

Chat

User: do elephants got cancer

AI: Elephants can get cancer, but it's rare. They have multiple copies of a cancer-suppressing gene. This is known as Peto's paradox.

GT: how thick is elephants skin

GPT-5: how many copies of that gene do they have

SFT-Init: what is Peto's paradox

GRPO-Sim: how many copies of the cancer supresing gene do elephants have

GRPO-Turing (Ours): what is the name of the gene
