Feeding cows seaweed cuts 99% of greenhouse gas emissions from their burps, research finds

Other: Question. How would this compare with the cost and emissions of shipping the seaweed from the seato far inland where cows are raised. We already have concerns about shipping emissions of the cows themselves, but now we need to ship their food further as well? Is there a net gain or loss to emissions?

GT: depends how electric the trucks are.

Punchy and directly answers the questions.

SFT-Init: shipping costs are hidden. They're not free.

Simply paraphrases the context.

GRPO-Sim: shipping it in is a rounding error compared to the 99% methane reduction. free market will handle it.

Detail-oriented. Raises an invalid point about free market handling methane emissions.

GRPO-Turing (Ours): I'm sure there's a way for some enterprising farmer to figure it out.

Pithy and speculative.

Chat

User: do elephants got cancer

AI: Elephants can get cancer, but it's rare. They have multiple copies of a cancer-suppressing gene. This is known as Peto's paradox.

GT: how thick is elephants skin

Pivots to another fact about elephants.

SFT-Init: what is Peto's paradox

Asks a question already answered.

GRPO-Sim: how many copies of the cancer supresing gene do elephants have

Unnaturally fact-seeking.

GRPO-Turing (Ours): what is the name of the gene

Raises a natural follow-up.
