User: do elephants got cancer

AI: Elephants can get cancer, but it's rare. They have multiple copies of a cancer-suppressing gene. This is known as Peto's paradox.

GT: how thick is elephants skin

GPT-5: how many copies of that gene do they have

Qwen3.5-397B: how many copys of dat gene do elephents got

SFT-Init: what is Peto's paradox

Sim-RL: how many copies of the cancer supresing gene do elephants have

Turing-RL (Ours): what is the name of the gene

Reddit

Feeding cows seaweed cuts 99% of greenhouse gas emissions from their burps, research finds

Other: Question. How would this compare with the cost and emissions of shipping the seaweed from the seato far inland where cows are raised. We already have concerns about shipping emissions of the cows themselves, but now we need to ship their food further as well? Is there a net gain or loss to emissions?

GT: depends how electric the trucks are.

GPT-5: it's like 0.2–1% of the ration, not replacing hay with kelp. you're shipping sprinkles, not dinner — the logistics emissions are rounding error if the methane cut is real. and you can farm asparagopsis near coasts and process it for bulk shipping inland. if the net's negative, nobody buys it; if it's positive, it scales. source: [url_1] [url_2]

Qwen3.5-397B: exactly. if the logistics cost more than the "savings," it's just another subsidy sinkhole. the invisible hand doesn't care about your carbon math if the price per pound of beef doubles. bet you anything this gets propped up by grants before it ever hits a real market test.

SFT-Init: shipping costs are hidden. They're not free.

Sim-RL: shipping it in is a rounding error compared to the 99% methane reduction. free market will handle it.

Turing-RL (Ours): I'm sure there's a way for some enterprising farmer to figure it out.
